PAIN POINTS
I FEEL AS A
LINKEDIN
USER, USING
NIELSEN
HEURISTICS

1. Aesthetic and minimalist design

Problem description: There exists unnecessary elements and rarely needed information in the job offers. The only and first point needed where all users go first is the requirements section, and that is kept somewhere at the bottom (when not defined by the job description at the beginning). This creates an effort for the user that needs to scroll down all the time. The top is filled with long job descriptions, banners from the platform to buy the premium option, sometimes a skills match button that might not aligned with the requirements, etc...

Severity: High. The probability of keeping the user engaged looking for more jobs reduces.

Suggested solution: Create a section only for the requirements for that job that the hire team fills and it is displayed at the beginning of the job offer, then followed by the job description. And consider the option for making a more accurate match, more related with the job requirements that with skills, specifically for the language.

✗ BEFORE

2. Consistency and Standards

Problem description: The digital experience has established different meanings for different icons and actions. The “thumb up” icon is associated with the action to like a post. However, the Spanish version of LinkedIn shows the word ‘recomendar’ -recommend-, creating confusion whether clicking on that icon will just give a like, repost, or both.

At the same time, you have the option ‘compartir’ -share-, which is the repost option from LinkedIn. But it is translated as to share, more linked to action of sharing the post with some contacts or contacts from another platform and not reposting.

Severity: Moderate.

Suggested solution: Keep consistency of meaning among languages, changing the word ‘recomendar’ -recommend- for ‘Me gusta’ -like-. And changing the word ‘compartir’ -share- for ‘Repostear’.

3. Consistency and Standards

Problem description: Again, there can be an understanding conflict when interacting with the buttons Repost and Send. The Send option allows you to share the post with any of your contact on LinkedIn. However, it can also give the idea that it is possible to share with contacts outside LinkedIn, and that is not possible. What is more, the Spanish version Repost is stated as 'Compartir' -share-, and Send as 'Enviar' – send-, creating a double confusion for the user because now there is nowhere stating the option to repost, only two icons inferring shari...

Severity: Moderate.

Suggested solution: as stated in the first point, keeping consistency of meaning among languages, keeping the first one written as 'Repost' ('Repostear in Spanish too), and the second one written as 'Share' ('Compartir in Spanish) and not Send, giving .

✓ AFTER

4. Consistency and Standards

Problem description: When clicking the thumb up icon, you are offered with more options. when reacting to posts you can choose among 6 different options. This standard is not followed globally, making the user confused about which one is the right to use, and the goal behind. There is even an option to like the post, stated with a heart icon, which can again enter in conflict with the thumb up icon.

Severity: Moderate.

Suggested solution: if LinkedIn has enough power, it can define new standards for these icons and new ways to reacting posts in the industry. A deep research should be carried to understand how users are adopting these icons, how comfortable they feel using them and if it is reflected when interacting with other platforms when seeing similar icons.
